Contents

I Propositions and Propositional Logic

A. Logic	2
B. Propositions	
1. Propositions and agreements	2
2. Other views of propositions	4
C. Words and Propositions as Types	5
D. Propositions in English	7
• Exercises for Sections A–D	8
E. The Basic Connectives of Propositional Logic	9
F. A Formal Language for Propositional Logic	
1. Defining the formal language	11
2. Realizations: semi-formal English	12
• Exercises for Sections E and F	14
G. Classical Propositional Logic	
1. <i>The Classical Abstraction</i> and truth-functions	15
2. Models	20
3. Validity and semantic consequence	20
4. Determining whether a wff is a tautology	22
H. Examples of Formalization	23
• Exercises for Sections G and H	27
J. Relatedness Logic	28
1. The subject matter of a proposition	
a. Relatedness relations	29
b. Subject matter as the content of a proposition	31
2. Models	32
K. An Overview of Semantics for Propositional Logics	35
• Exercises for Sections J and K	38

II The Internal Structure of Propositions

A. Things, the World, and Propositions	39
B. Names and Predicates	42
C. Propositional Connectives	44
D. Variables and Quantifiers	45
E. Compound Predicates and Quantifiers	47
F. The Grammar of Predicate Logic	48
• Exercises	49

III A Formal Language for Predicate Logic

A. A Formal Language	50
B. The Unique Readability of Wffs	53
C. The Complexity of Wffs	55
D. Free and Bound Variables	56
E. The Formal Language and Propositions	58
• Exercises	59

IV Semantics

A. Syntax vs. Semantics as a Basis for Logic	63
B. Atomic Propositions	64
C. Names	
1. A name picks out at most one thing	65
2. A name picks out at least one thing	65
D. Predicates	
1. A predicate applies to an object	68
2. Predications involving relations	71
3. Other conceptions of predicates and predications	74
4. How many predicates are there?	76
E. Naming, Pointing, and What There Is	
1. Agreements	77
2. Naming, pointing, and descriptions	79
3. Avoiding names completely?	81
4. Forms of pointing: what there is	81
• Exercises for Sections A–E	84
F. The Universe of a Realization	87
G. <i>The Self-Reference Exclusion Principle</i>	90
H. Models	
1. The assumptions of the realization: <i>Form and Meaningfulness</i>	92
2. Interpretations: assignments of references and valuations	94
3. <i>The Fregean Assumption and The Division of Form and Content</i>	98
4. The truth-value of a complex proposition	99
5. Truth in a model	104
J. Logics, Validity, Semantic Consequence	108
• Exercises for Sections F–J	114
<i>Summary Chapters II–IV.J</i>	116
K. Tarski’s Definition of Truth	117
1. Eliminating semantic terms: Convention T	118
2. Other logics, other views of truth	122
L. Extensionality	
1. Intensional predicates	123
2. <i>The Extensionality Restriction</i>	125

3. Quantification and intensional predicates	
a. Languages without names	127
b. Models in which every object is named	128
c. Inconsistent predications and quantification	128
M. Other Interpretations of the Quantifiers and the Use of Variables	
1. A current variation on Tarski's definition	129
2. The substitutional interpretation	129
3. Naming all elements of the universe at once	131
4. Surveying all interpretations of the name symbols	132
• Exercises for Sections K–M	133

V The Logical Form of a Proposition

A. Rewriting English Sentences	137
B. Common Nouns as Subject and Object	
1. Relative quantification: \forall	139
2. Relative quantification: \exists	142
3. <i>Nouns into Predicates</i>	144

D. Indexicals	148
E. Adverbs	149
F. Tenses	151
G. Collections and Qualities	154
H. Mass Terms	157
J. Aristotelian Logic	159
K. Formalizations Relative to Formal Assumptions	
1. Analysis vs. formalization	162
2. Extending the scope of predicate logic	163
3. Formalizing a notion	164
L. <i>Criteria of Formalization</i>	165
M. Examples of Formalization	172
• Exercises	201

VI Identity

A. Identity	208
B. The Equality Predicate	210
C. The Interpretation of '=' in a Model	211
D. The Identity of Indiscernibles	
1. <i>The Predicate Logic Criterion of Identity (p.l.c.i.)</i>	213
2. The <i>p.l.c.i.</i> vs. the implicit identity of the universe	215
3. The <i>p.l.c.i.</i> and names	216
4. Validity	217
E. Is the Equality Predicate Syncategorematic?	221
• Exercises	223

VII Quantifiers

A. The Order of Quantifiers	
1. $\forall x \exists y$ and $\exists y \forall x$	225
2. $\forall x \exists y$ and $\exists x \exists y$	226
3. Superfluous quantifiers	226
B. The Scope of Quantifiers: Substituting One Variable for Another . . .	227
C. Names, Quantifiers, and Existence	230
D. Is ‘— exists’ a Predicate?	232
E. Quantifying Over a Finite Universe: \forall as Conjunction, \exists as Disjunction	233
F. Modeling Other Quantifiers	
1. Positive quantifiers: ‘there are at least n ’	234
2. Negative quantifiers: ‘there are at most n ’, ‘no’, ‘nothing’	236
3. Exact quantifiers: ‘there are exactly n ’	237
4. Quantifications we can’t model	238
G. Relative Quantification	
1. <i>Nouns into Predicates</i> revisited	239
2. Formalizations involving the same quantifier	240
3. Formalizations involving mixtures of quantifiers	242
H. Examples of Formalization	243
• Exercises	257

VIII Descriptive Names

A. Descriptive Names: A Problem in Formalization	263
B. Descriptive Names Relative to Formal Assumptions	265
C. Russell’s Method of Eliminating Descriptive Names from Atomic Propositions	266
D. Eliminating All Names?	269
E. Examples of Formalization	272
• Exercises	279

IX Functions

A. Name-Makers	282
B. Functions	
1. A definition	285
2. Terms	286
3. The value of a function	286
4. Functions compared to predicates	288
C. A Formal Language with Function Symbols and Equality	289
D. Realizations and Truth in a Model	291

E. Partial Name-Makers

with an Analysis of Reasoning about Process

A General Framework For Semantics for Predicate Logics projected

To Juney, in loving memory
'Come, let me sniff your soul'
Arf

Preface

If logic is the right way to reason, why are there so many logics?

In *Propositional Logics* I showed that the forms of reasoning we use depend on what we pay attention to in our reasoning. There is a fundamental unity to the structure of our reasonings. Various logics arise within a general framework of semantics that depend on which, if any aspect of propositions we pay attention to in addition to truth-value, for example, ways in which the proposition could be true, or information content, or subject matter, or ways in which we could come to know the truth-value of the proposition. Propositional logic—reasoning with propositions as wholes, ignoring their internal structure—is summarized in Chapter I.

But what if we consider the internal structure of propositions? Is there still a unity of logics?

In this volume I look at the standard way that logicians parse the internal structure of propositions, what is called *predicate logic*. Most propositional logics have or can be given extensions in the richer language of predicate logic. My goal here is to find or suggest agreements about language, the world, and reasoning that can account in a uniform way for those extensions.

My focus in describing those agreements will be in viewing logic as a form of reasoning in language. Logic, I believe, can be understood best as something we do, whether it be prescriptive or descriptive. The agreements we make about our forms of reasoning seem based on ideas about the relation of language and the world which, if ignored, lead only to empty symbolism. Those agreements, I stress, need not be conventions. They may arise from the nature of the world, or the way our bodies are built, or the reality of abstract forms, or I am not able to say. But what I can do here is give a story that seems to me to unify the various stories of many logicians.

I had at one time hoped to give technical developments of many predicate logics in this volume. That, it has turned out, is too large a task, and I have chosen to defer the technical development of particular predicate logics to other volumes, whose contents I describe at the end of the table of contents.

For a philosopher, the project of this volume may seem commonplace: an account of propositions and semantics. For a mathematician or computer scientist it may seem less clear why this concern is important. But understanding the basis of predicate logic is essential for formalizing ordinary language reasoning, which is the heart of artificial intelligence and every use of computers to glean information from what we present to them. Moreover, the uniform treatment of all predicate logics makes it clearer when a logic is or is not suitable for a particular task of formaliza-

PREFACE

tion, and allows for the construction of other logics to codify reasoning in contexts outside the scope of current logics.

Briefly, the contents of this volume are as follows:

Chapter I is devoted to a summary of reasoning with propositions as wholes, propositional logic.

In Chapter II the predicate logic way of parsing propositions into predicates and names is introduced. A formal language in Chapter III gives structure and precision to that way of parsing.

Chapter IV connects reasoning in language to ideas about the world and the nature of truth, giving a semantic analysis of reasoning with predicate logic forms. The notion of a model and realization are developed in such a way as to serve as the basis for a spectrum of logics, without specifying any one particular logic from that spectrum.

In Chapter V I turn to the issue of how to formalize ordinary reasoning in predicate logic. To formalize is to translate from our daily language to the language of predicate logic. Formalizations, then, should satisfy the standards of a good translation: They should preserve inferences, respect form when possible, preserve meaning. I present criteria for judging a formalization in Chapter V that are tested and that shape the work in the succeeding chapters.

Chapter VI deals with how to formalize “is the same as” in predicate logic. Chapter VII adopts standards for formalizing propositions that use ordinary language quantifications. In Chapter VIII the criteria of formalizing force a decision about how we shall formalize propositions containing descriptive names. Chapter IX then deals with how to incorporate functions in the language of predicate logic.

Chapter X considers parsing propositions to account for further structure in our reasoning, quantifying over not only individual things but also collections or predicates of those things. Disputes about the nature of predicates do not affect the basis of predicate logic, since predicates are used only to the extent that they can be identified with pieces of language. However, in an analysis of reasoning that allows for quantifying over predicates, disagreements are sufficient to generate no common logic. Whether the collection of all predicates contains objects that cannot be identified with pieces of language affects the forms of reasoning that are deemed valid.

The presentation of the ideas in each chapter begins with a few examples as motivation to lead to an exposition of general principles. Those principles are then examined in a series of examples that are discussed in detail in an example/analysis format. Some examples are meant only to illustrate the meaning or use of a principle, but many advance the theory.

In the final chapter and first appendix I summarize the views that have motivated this development of logic, trying to explain further why they seem to me to make a good story. I hope to have given a good story, one that not only accounts for why there are so many logics, but also answers: Why predicate logic? Still, I do

not claim that this is the only story, nor that it is especially original: The literature on predicate logic is vast, and I regret that I cannot trace here the history of the subject nor give adequate space to other stories of how we should reason.

I have included many exercises, some of them routine and some requiring considerable thought. There is no instructor's manual, for often there may be more than one good answer, more than one way to argue a point or formalize a proposition, and those differences will, I hope, stimulate you to come to your own views on the nature of logic.

* * * * *

Since the first publication of this work in 1994 I have extended my research to much of the traditional scope of logic and have shown how to expand the scope of what can be formalized in predicate logic. The publications in which I have done that are listed in the bibliography, and most of that work is now available from the Advanced Reasoning Forum, <www.AdvancedReasoningForum.org>. It would be too large a project for me to try to modify this text to take account of that now. There is one point, though, that should be noted: Where I talk here of arguments or deductions in formal logic I believe now that it is better to speak of inferences. I have corrected a few typographical errors in the previous edition.

Acknowledgements

I am grateful to many people who suggested improvements to earlier drafts of this work, particularly Stephen Barker, Angela Maria Paiva Cruz, Newton da Costa, Stanisław Krajewski, Fred Kroon, Peter Loftson, Piergiorgio Odifreddi, Jerzy Perzanowski, Bill Robinson, and Charles Silver. My conception of the role of things in predicate logic and the analysis of the examples benefitted greatly from many stimulating conversations with the late George Hughes, a scholar and friend.

I am also grateful to the Conselho Nacional de Desenvolvimento Científico e Tecnológico (CNPq) of Brazil for funding a visit to the University of Paraíba in João Pessoa to teach a course in 1991 on Chapters I–V, and to Matias Francisco Dias and Wilma Fernandes de Lucena for arranging that.

The diction and organization of this book were improved by my copyeditors, Steve Susoeff and Jennifer Geerlings, whose patience is much appreciated.

But above all, this volume is due to the encouragement and help that Peter Eggenberger and Benson Mates provided so freely. Their gentle proddings have helped to shape my confused searchings into a text.

What is best in these notes comes from the generous help of all these people. To them and any others I may have inadvertently forgotten, I am most grateful.
